### No For Honor

Honor codes have been a topic in college as a form of self government for students, with discussion in the effectiveness of the honor system for students. The honor system is meant to encourage students to be on behavior and for school, the premise is to prevent rule breaking. Today Coalinga has no honor code, students have not been asked for or encouraged students to have a form of self governance. Honor codes shouldn't be established in Coalinga high school since it is redundant, if it was implemented into the school it would be done with an insignificant amount of change. With multiple studies placing focus on the idea finding the least effects it has given. Trying to establish it is a waste of time and just simply using other tools to help

Source A, the purpose of an honor code is to give students the encouragement to self govern to have integrity, that means there must be no outside factor that enforces this behavior. But source A a cartoon shows a line with the use of a camera to enforce it (Bacall). This goes against an honor code, whose purpose is to prevent cheating by making the students be reliable. With common sense, if the goal of a system is to prevent cheating by making the students be able to enforce themselves? Then, the camera detests the effectiveness of honor codes if it must be enforced by outside forces. The honor code is just rules hidden in the guise of integrity. If it just devolves to rules then no wishful thinking can implement it, it is just another addition to the rules because one can tell in its core concept it means nothing. What can be obtained from source A is

that it is a jest to the thought of using a camera to improve the honor code when it ultimately breaks its core idea. What can be better to use to not supplement the honor code

Along with source E, a survey conducted by student honor councils, the purpose of which was to assess academic integrity taken from 275 people from fall 2007 to spring 2008 in their university of a meager amount. 65% of the 275 students have confirmed it was discussed in class, if that percentage had discussed it then it must mean that more than half of these students that were surveyed were aware. According to Sledge, “40% have admitted to violating the honor code and have not been caught” (Sledge). 275 students with 40% of them have confirmed cheating and 65% have confirmed discussion and Coalinga, which is a high school, a public school, which will have significantly more students than a small private university. The amount to enforce back to source A, which defeats the purpose of the honor code, would be much higher and the number of students if just 40% violating the honor code is still a lot. The overall wanted effect by most schools, which is less cheating and following of rules, would not be achieved by this.

What they do to find these cheaters: they launch an investigation or scanning for cheating, they then root out the cheaters and they get caught after the professor had scanned papers. Which Coalinga already does with advanced websites even being used to detect AI usage in papers, and many other websites to find stolen words. There is really no point in trying to put in an honor code if Coalinga has all of these tools. In just a single search result can beat a year worth of effort trying to place in an honor code to stop cheating. To put with this the niche filled by the honor code is already filled by already made tools even AI have been trained to detect cheaters or Citation Machine.

Adding more with source, D have shown an article, which discusses the university of virginia it stated all the way back to 1842 there was an honor code. Then in 2002, this paper reported a cheating scandal with 157 investigations on suspected cheating, 39 dropped or expelled. With a professor in source, D saying his insight on the cheating scandal is due to easier sources to cheat with aka the internet. With him saying he found exams similar to each other meaning it was done in collaboration with other students (Kahn). One may say that source D showcases a success of 39 students caught and that it cemented all the way from 1842 to 2002, this honor code has worked. But this is current times 2026, January 27, back in 2002 those were only rudimentary phones and computers. The emergence of browsers such as Google, Bling, Youtube, and etc, AI such as Chat GPT devices which can access the internet easily 1000 for a phone like iphone. This is clear modernism making honor code even more obsolete and Coalinga is in the present and that was in the past. If computers in 2002 can break a traditional honor code back in 1842 then the current technology possessed can easily allow cheating adding more to the ineffectiveness of the honor code. Case point is why waste time trying to implement an honor code that wouldn't even work to prevent cheating if it didn't work in a university in a more older time. Instead a better solution is using technology to help detect cheating such as turnitin, which has an AI to detect AI generated answers. That is already there and has a whole organization dedicated to it.

The article "Cheating Has Become Normal" by Beth McMurtie. This article was made recently in 2024, with more examples of colleges like the one in source, D such as Middlebury College and Stanford University. With Middlebury College reporting on a yearly survey 35% in 2019 to 65% students in 2024 admitted to cheating (McMurtie). Middlebury college has 2,760 enrolled students meaning 1794 students have cheated in college. According to Ed Data there

are 1394 students enrolled in Coalinga (Ed Data). That is 2 times the amount of cheaters in a school compared to all of the students in Coalinga. Source E gets proven with E being 65% students cheating the percent are consistent meaning this isn't just a one case and an outlier. If honor code is a culture according to the article cheating is also a culture with the claim made that students treat it as a normal thing. We can easily infer that in these schools students have cheated and it is casual, trying to implement an anti cheating culture against an existing cheating one will not fare well. Relating to the point where the professor has found students with similar answers on their exam, which was a collaboration of cheating (Kahn). The best way to defeat the cheating culture is to try to stop cheating by checking work and methods used since forever.

In another article with Roth, Clare "Ohio State Charges 83 Students With Using Group Chat To Cheat On Tests" WOSU. The Ohio State university had caught 83 students in one classroom cheating, sharing answers with each other (Roth). Back to the source by McMurtie this wasn't spread out amongst a bunch of unrelated students. This was a team effort cheating a major collaboration, which suggests a strong cheating culture. How does this relate to Coalinga? Firstly Ohio doesn't have a honor code but it was established in 1870, it is more so a public university and Coalinga is a public high school. With all the similarities it is clear there is a preexisting cheating culture in both, meaning if one wants to add the honor code culture it will have to compete with the cheating culture, which has been around for longer. Logically the larger and older will be harder to be replaced by a new thing wasting time trying to implement it, what Ohio university did after said incident was implementing better technology to detect cheating. Which Coalinga is already doing so why even waste more time. When we are working on a solution we are creating 2 solutions for just one problem. Though one will try to argue due to the lack of

honor code the cheating grew that much from it. Looking back at Kahn's article the university, which had been implemented since 1850 20 more years (Kahn). Yet that still suffered cheating.

In the end of all of this from the breaking of the purpose with sarcasm in cartoons, statistics showing honor codes not working in various schools, and cheating culture. What was learned? That honor code has been tried, contested, and replaced. The main purpose of the honor code was to find a way to make students self-govern the cheating but it failed. With the rise of technology it has added better solutions that are faster acting, there are arguments in an ideal situation that if honor code was properly implemented it would remove the need of technology being used in an arms race to prevent cheating. But if that was the case then ideally there wouldn't need to be an honor code in both an ideal and non ideal situation. Honor code will be redundant and useless to add to the school.
